

EXAMINATION 1 VERSION A “Review of Perfect Competition”

INSTRUCTIONS: This exam is closed-book, closed-notes. Simple calculators are permitted, but graphing calculators or calculators with alphabetical keyboards are NOT permitted. Mobile phones or other wireless devices are NOT permitted. Points will be subtracted for illegible writing or incorrect rounding. Point values for each question are noted in brackets.

I. Multiple choice: Please circle the one best answer to each question. [1 pt each, 34 pts total]

- (1) In the U.S., antitrust laws are enforced at the federal level by
- Department of Justice.
 - Department of Commerce.
 - Federal Trade Commission.
 - both (a) and (c).
- (2) The purpose of antitrust policy is primarily to
- promote competition.
 - control monopoly.
 - limit externalities.
 - remedy problems of asymmetric information.
- (3) In some industries, prices and the entry of new firms are regulated by
- the Department of Justice.
 - the Federal Trade Commission.
 - various regulatory agencies.
 - the Department of Commerce.
- (4) “Positive analysis” of regulation asks
- what regulatory policy should be.
 - why regulation occurs in some industries and not others.
 - whether regulation is a “net plus” for society.
 - All of the above.
- (5) An increase in the price of oranges will
- shift the demand curve for oranges to the right.
 - shift the demand curve for oranges to the left.
 - rotate the demand curve for oranges so that it becomes steeper.
 - rotate the demand curve for oranges so that it becomes flatter.
 - None of the above.
- (6) A fall in the price of Android smart phones will shift the demand for Apple iPhones to the left, since Android phones and iPhones are
- complementary goods.
 - substitute goods.
 - normal goods.
 - inferior goods.
- (7) Spaghetti sauce is made from tomatoes, so if the price of tomatoes rises, then the
- demand for spaghetti sauce will shift left.
 - demand for spaghetti sauce will shift right.
 - supply of spaghetti sauce will shift left.
 - supply of spaghetti sauce will shift right.
- (8) If a new, more efficient method for growing rice is developed, then
- demand for rice will shift left.
 - demand for rice will shift right.
 - supply of rice will shift left.
 - supply of rice will shift right.
- (9) Excess demand in the market for cars would occur if the actual price of cars were
- greater than the equilibrium price.
 - less than the equilibrium price.
 - too close to the equilibrium price.
 - cannot be determined from the information given.

- (10) Which demand curve below is *less* elastic?
- a. Demand curve A.
 - b. Demand curve B.
 - c. Both have the same elasticity because they pass through the same point.
 - d. Cannot be determined from information given.

- (11) A good that has close substitutes will likely have a price elasticity of demand that is
- a. small, in absolute value.
 - b. large, in absolute value.
 - c. zero.
 - d. infinite.
 - e. cannot be determined.

- (12) The price elasticity of demand for food is about -0.2 . If the price of food rises, then the amount of money consumers spend on food will
- a. increase.
 - b. decrease.
 - c. remain constant.
 - d. cannot be determined from information given.

- (13) The supply curve in the graph below is
- a. perfectly elastic.
 - b. perfectly inelastic.
 - c. unitary elastic.
 - d. Cannot be determined from information given.

- (14) If a firm is making zero economic profit,
- a. it is making a negative accounting profit.
 - b. it is enjoying a normal rate of return on investment.
 - c. it will likely soon shut down.
 - d. its workers cannot be paid.

- (15) The increase in cost caused by the last unit of output is called
- a. marginal cost.
 - b. marginal revenue.
 - c. average cost.
 - d. unit cost.

- (16) If at a certain level of output, marginal cost is *less than* average cost, then the average cost curve must be
- a. upward-sloping.
 - b. downward-sloping.
 - c. at its minimum point.
 - d. Cannot be determined from information given.

- (17) Marginal revenue is defined as
- a. the increase in revenue from the last unit of output.
 - b. change in revenue divided by change in output quantity.
 - c. the slope of the total revenue curve.
 - d. $\Delta TR / \Delta Q$.
 - e. any of the above.

- (18) At its current level of output, ABC Company's marginal cost is \$10, its average cost is \$7, and its marginal revenue is \$15. If ABC produces and sells one more unit of output, its profit will
- a. increase by \$3.
 - b. increase by \$5.
 - c. increase by \$8.
 - d. increase by \$15.
 - e. remain constant.

- (19) A cost that you cannot avoid no matter what action you take is called
- a. an opportunity cost.
 - b. a marginal cost.
 - c. a variable cost.
 - d. a sunk cost.
 - e. an average cost.

- (20) In the *short run*, a firm should continue operating if its revenue is sufficient to pay at least its
- a. fixed cost.
 - b. variable cost.
 - c. total cost.
 - d. accounting cost.

(21) Efficiency in production requires that all firms in the same industry

- a. have equal levels of output.
- b. have equal average cost.
- c. have equal marginal cost.
- d. have equal total cost.
- e. All of the above.

(22) New firms enter an industry because they hope to

- a. drive down the market price.
- b. drive down the profits of existing firms.
- c. enjoy economic profit.
- d. increase consumer surplus.

(23) When firms *enter* [firms exit] an industry, this has the effect of shifting the short-run supply curve

- a. to the right.
- b. to the left.
- c. up.
- d. Cannot be determined from information given.

(24) *Price equals average cost* in a competitive industry in long-run equilibrium because

- a. business owners have a sense of fairness.
- b. individual firms adjust their output levels using the rule "price equals average cost" to maximize profit.
- c. consumers refuse to pay more than what is reasonable.
- d. positive profits encourage entry of new firms while negative profits encourage existing firms to leave the industry.
- e. the threat of government regulation causes firms to hold prices down.

(25) Alyson is willing to pay \$800 for an iPhone, but fortunately the price is only \$500. If she buys an iPhone, her consumer surplus is

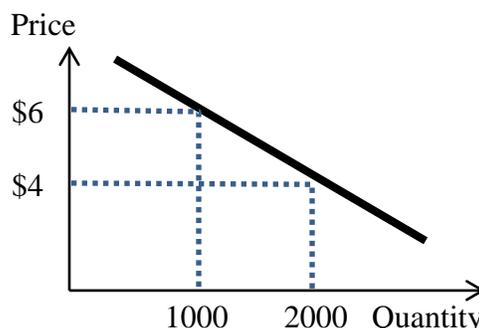

- a. zero.
- b. \$200.
- c. \$300.
- d. \$500.
- e. \$800.

(26) At any point on the demand curve for ice cream, the height of the demand curve equals

- a. consumer surplus on that pint of ice cream.
- b. consumers' willingness to pay for that pint of ice cream.
- c. marginal cost of producing that pint of ice cream.
- d. producer surplus on that pint of ice cream.

(27) The graph below shows the demand for sandwiches. If the market price of sandwiches falls from \$6 to \$4, then total consumer surplus

- a. increases by \$2000.
- b. increases by \$3000.
- c. increases by \$4000.
- d. decreases by \$2000.
- e. decreases by \$3000.
- f. decreases by \$4000.

(28) Suppose there is a change in government policy affecting the automobile industry. Which of the following outcomes would be a *Pareto improvement*?

- a. Producers gain \$10 billion while consumers lose \$20 billion.
- b. Producers gain \$20 billion while consumers lose \$10 billion.
- c. Producers gain \$10 billion while consumers gain \$20 billion.
- d. Both (b) and (c).
- e. All of the above.

(29) Suppose for some reason that the quantity traded in the market for cupcakes is 10 million cupcakes, but the market is not in equilibrium. Rather, at this quantity, the height of the supply curve is \$5 and the height of the demand curve is \$2. Then producing one more cupcake would

- a. increase social welfare by \$2.
- b. decrease social welfare by \$3.
- c. increase social welfare by \$5.
- d. decrease social welfare by \$2.
- e. Cannot be determined without knowing the equilibrium price.

(30) A perfectly competitive firm expects that if it increases its output, this will cause the price to

- a. increase.
- b. decrease.
- c. stay the same.
- d. cannot be determined from information given.

(31) Suppose the market elasticity of demand for in a particular industry equals -5. Firm X's market share is 4% (or 0.04). Assuming other firms do not change their levels of output, then Firm X perceives an elasticity of demand equal to

- a. -0.04.
- b. -5.
- c. -20.
- d. -100.
- e. -125.

(32) A price floor (or legal minimum price) on bananas, if it were binding, would create

- a. excess demand for bananas.
- b. excess supply of bananas.
- c. neither excess demand nor excess supply.
- d. Cannot be determined from information given.

(33) A quota on sellers of baseball bats would have basically the same effect on the market for baseball bats as

- a. a price ceiling on baseball bats.
- b. a price floor on baseball bats.
- c. a tax on baseball bats.
- d. a subsidy for baseball bats.
- e. a free market for baseball bats.

(34) A firm that enjoys economies of scale has an average cost curve that

- a. slopes up.
- b. slopes down.
- c. is horizontal.
- d. is vertical.

II. Problems: Insert your answer to each question in the box provided. Use margins and graphs for scratch work. Only the answers in the boxes will be graded. Work carefully—partial credit is not normally given for questions in this section.

(1) [Using price elasticity of demand: 10 pts] Suppose the price elasticity of demand for milk is **-0.6**. Suppose milk producers cooperate to decrease output by 3%. Assume the demand curve does not shift.

- a. Is demand for milk elastic, inelastic, or unitary-elastic?
- b. Will the price of milk *increase or decrease*?
- c. ... by about how much?
- d. Will revenue received by milk producers *increase or decrease*?
- e. ... by about how much?

	%
	%

(2) [Profit maximization: 10 pts] Suppose a firm's total revenue function is given by $TR(q) = 5q$, and its total cost function is given by $TC(q) = 0.01q^2 + q$. Find the following, showing your work and circling your final answers.

a. Find the firm's marginal revenue function $MR(q)$.

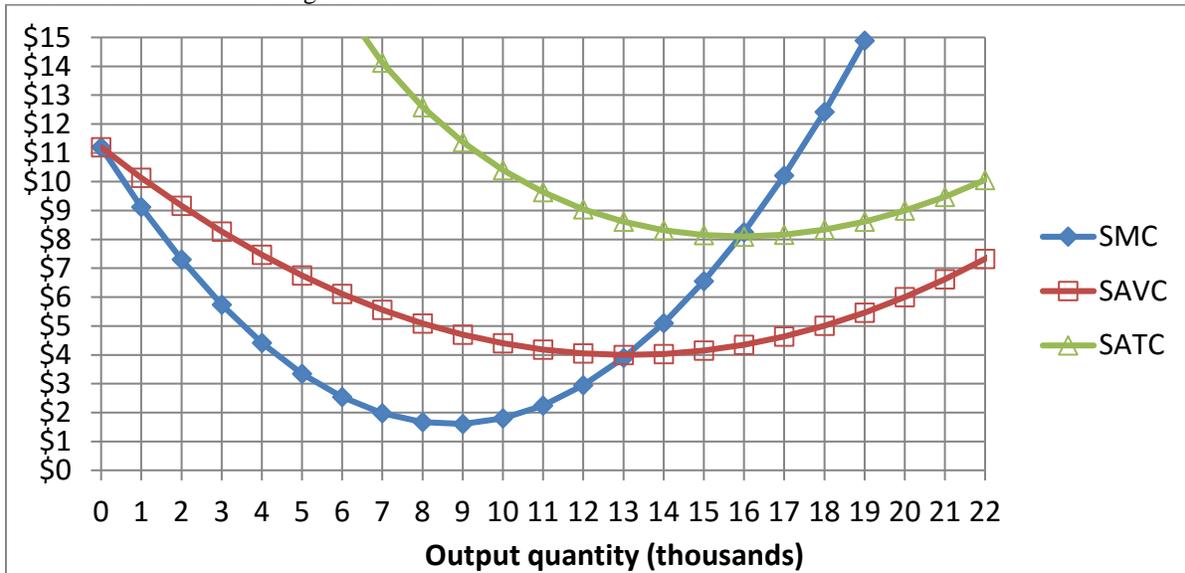

b. Does this firm take price as given? Why or why not?

c. Find the firm's marginal cost function $MC(q)$.

d. Compute the firm's profit-maximizing level of output q^* . Show your work and circle your final answer.

e. Compute the firm's total profit. Show your work and circle your final answer.

(3) [Short-run cost curves and supply: 24 pts] General Products Company is a small firm in a big market, and therefore takes its output price as given. In the short run, the company faces weekly cost curves as shown in the following diagram. Here, SMC denotes short-run marginal cost, SAVC denotes short-run average variable cost, and SATC denotes short-run average total cost.

Suppose the company were currently producing 20 thousand units of output, for some unknown reason.

- a. Compute the company's short-run total cost, to the nearest thousand.

\$	thousand
----	----------
- b. Compute the company's short-run variable cost, to the nearest thousand.

\$	thousand
----	----------
- c. Compute the company's short-run fixed cost, to the nearest thousand.

\$	thousand
----	----------

Suppose the company were currently producing 7 thousand units of output, for some unknown reason.

- d. If the company produced one more unit, by how much would its total cost increase?
 That is, what would be the *change in total cost* as the company increased output from 7000 to 7001 units? (Give an answer to the nearest dollar.)

\$	
----	--
- e. What is the company's break-even price—that is, the lowest price at which the company can avoid losses? (Give an answer to the nearest dollar.)

\$	
----	--
- f. What is the company's shut-down price—that is, the lowest price at which it will remain in operation in the short run? (Give an answer to the nearest dollar.)

\$	
----	--
- g. Suppose the price of output is \$10. How many units will the company produce?

	thousand
--	----------
- h. Will the company make a *profit* or a *loss* at a price of \$10, or will it *break even*?

--	--
- i. Suppose the price of output is \$5. How many units will the company produce?

	thousand
--	----------
- j. Will the company make a *profit* or a *loss* at a price of \$5, or will it *break even*?

--	--
- k. Suppose the price of output is \$3. How many units will the company produce?

	thousand
--	----------
- l. Will the company make a *profit* or a *loss* at a price of \$3, or will it *break even*?

--	--

(5) [Welfare analysis of price controls: 18 pts] The following graph shows the market for artichokes.

a. Find the equilibrium price without government intervention.

\$	
----	--

Suppose the government imposes a price ceiling (or legal maximum price) of \$3. No artichokes may be sold for a price greater than the price ceiling.

b. How many artichokes will actually be sold?

	thousand
--	----------

c. Will there be *excess demand*, *excess supply*, or *neither*?

--

d. How much?

	thousand
--	----------

e. Does producer surplus *increase*, *decrease*, or *remain constant* because of the price ceiling, as compared to the market without government intervention?

--

f. By how much?

\$		thousand
----	--	----------

g. Does consumer surplus *increase*, *decrease*, or *remain constant* because of the price ceiling, as compared to the market without government intervention? (Assume optimistically that artichokes are bought by those consumers who value artichokes the most.)

--

h. By how much?

\$		thousand
----	--	----------

i. Compute the deadweight social loss caused by the price ceiling.

\$		thousand
----	--	----------

III. Critical thinking: Write a one-paragraph essay answering *one* question below (your choice). Full credit requires correct economic reasoning, legible writing, good grammar including complete sentences, and accurate spelling. [4 pts]

- (1) Suppose you operate a lawn-mowing business in a competitive market, where everyone charges about \$20 for an average-size lawn. You know that on the one hand you can easily expand your business if you just post a few signs, and on the other hand you can easily downsize your business by not replacing customers as they drop off. In other words, you can take the price of \$20 as given. You review your costs to decide what to do. You discover that your average cost per lawn is about \$10, but your marginal cost per lawn is about \$30. Should you expand your business, downsize it, or neither? Justify your answer.
- (2) Suppose that when the *price* of gasoline falls by 10 percent, consumer *spending* on gasoline falls by 6 percent.
 - a. According to these figures, is demand for gasoline *elastic* or *inelastic* ?
 - b. Compute the price elasticity of demand for gasoline. Show your work and circle your final answer.

[end of exam]
