

FINAL EXAMINATION VERSION B

INSTRUCTIONS: This exam is closed-book, closed-notes. Calculators, mobile phones, and wireless devices are NOT permitted. Point values for each question are noted in brackets. Maximum total points = 200.

I. MULTIPLE CHOICE: Circle the one best answer to each question. Feel free to use margins for scratch work [2 pts each—40 pts total].

(1) Which utility function below violates the assumption of "monotonicity" or "more is better"?

- a. $U(q_1, q_2) = 7 q_1^5 q_2^2$.
- b. $U(q_1, q_2) = 5 q_1^{1/2} + 2 q_2^{1/2}$.
- c. $U(q_1, q_2) = 7 q_1 q_2$.
- d. $U(q_1, q_2) = (5q_1) / (2q_2)$.

(2) This consumer could enjoy higher utility, without increasing total spending, by

- a. purchasing less food and more other goods.
- b. purchasing more food and fewer other goods.
- c. purchasing less food and fewer other goods.
- d. any of the above.
- e. none of the above.

The next two questions refer to the following graph of a consumer's budget line and indifference curves. Suppose the consumer is currently at bundle A for some reason.

(3) Let MU_1 denote the marginal utility of other goods and MU_2 the marginal utility of food for this consumer. Let p_1 denote the price of other goods and p_2 denote the price of food. At bundle A,

- a. $MU_2 = MU_1$ and $p_2 = p_1$.
- b. $MU_2/MU_1 = p_2/p_1$.
- c. $MU_2/MU_1 < p_2/p_1$.
- d. $MU_2/MU_1 > p_2/p_1$.
- e. cannot be determined from information given.

(4) Which function is *not* homogeneous of degree zero in income and prices?

- a. $q_1^* = I / (p_1 + p_1^{1/2} p_2^{1/2})$.
- b. $q_1^* = I/(8p_1) + 3$.
- c. $q_1^* = 0.9 I - 3p_1 + 0.1 p_2$.
- d. $q_1^* = 2p_2/p_1 + I/(6p_1)$.
- e. All are homogeneous of degree zero.

(5) Suppose a firm produces an output using capital and labor. The increase in output from a one-unit increase in labor input, while holding capital input constant, is called

- the average product of labor.
- the price of labor.
- the marginal product of labor.
- the marginal rate of substitution in production of labor for capital.

(6) In the short run, a firm should shut down immediately if its

- revenue is less than producer surplus.
- revenue is less than variable cost.
- revenue is less than fixed cost.
- profit is negative.

(7) *Price equals marginal cost* in a competitive industry in both short-run and long-run equilibrium because

- business owners have a sense of fairness.
- individual firms adjust their output levels to maximize profit.
- consumers refuse to pay more than what is reasonable.
- positive profits encourage entry of new firms while negative profits encourage existing firms to leave the industry.
- the threat of government regulation causes firms to hold prices down.

(8) Suppose there is a change in government policy affecting the automobile industry. Which of the following outcomes would be a *potential Pareto improvement*?

- Producers gain \$5 billion while consumers are unaffected.
- Producers gain \$5 billion while consumers lose \$10 billion.
- Producers gain \$10 billion while consumers lose \$5 billion.
- Both (a) and (c).
- All of the above.

The next two questions refer to the following Edgeworth box diagram for production. The solid curves are Firm 1's isoquants. The dashed curves are Firm 2's isoquants.

(9) From allocation A, *both* firms can produce more output if

- Firm 1 gives Firm 2 some capital, and Firm 2 gives Firm 1 some labor.
- Firm 1 gives Firm 2 some labor, and Firm 2 gives Firm 1 some capital.
- Firm 1 gives Firm 2 some capital and some labor.
- Firm 2 gives Firm 1 some capital and some labor.
- No trade will allow both firms to produce more output.

(10) From allocation B, *both* firms can produce more output if

- Firm 1 gives Firm 2 some capital, and Firm 2 gives Firm 1 some labor.
- Firm 1 gives Firm 2 some labor, and Firm 2 gives Firm 1 some capital.
- Firm 1 gives Firm 2 some capital and some labor.
- Firm 2 gives Firm 1 some capital and some labor.
- No trade will allow both firms to produce more output.

(11) Suppose all firms in an industry have the same marginal cost. According to the Cournot model of oligopoly, the equilibrium quantity will be greater,

- a. the more firms in the industry.
- b. the fewer firms in the industry.
- c. The quantity does not depend on the number of firms in the industry.

(12) Which market model predicts the largest quantity of total output?

- a. Price competition.
- b. Collusion to maximize joint profits.
- c. Cournot oligopoly.
- d. All models predict the same quantity of output, if all use the same assumptions about market demand and marginal cost.

(13) According to the so-called “Coase theorem,” external costs like pollution can be efficiently resolved if bargaining is efficient and

- a. property rights are given to the victim of pollution.
- b. property rights are given to the polluter.
- c. either of the above.
- d. none of the above.

(14) An efficient way to distribute pollution permits is

- a. to sell them at auction.
- b. to allow them to be bought and sold by polluters.
- c. either of the above.
- d. to assign them by a lottery.

(15) Sonic Burgers requires you to pay for a hamburger before you eat it. Only one person can eat the hamburger, of course. So a hamburger from Sonic is

- a. a nonrival good.
- b. a nonexcludable good.
- c. both of the above.
- d. none of the above.

(16) If one person downloads a particular electronic book, the same e-book can be downloaded by other people. However, everyone who downloads the e-book is forced to pay for it. This e-book is therefore

- a. a nonrival good.
- b. a nonexcludable good.
- c. both of the above.
- d. none of the above.

(17) A risk-averse person's utility function shows

- a. constant marginal utility of wealth (or income).
- b. decreasing marginal utility of wealth (or income).
- c. increasing marginal utility of wealth (or income).
- d. none of the above.

(18) Which utility function shows risk aversion?

- a. $U(W) = 2 + 5^W$.
- b. $U(W) = 2 + 5W$.
- c. $U(W) = 2 + 5W^2$.
- d. $U(W) = 2 \ln(5W)$.

(19) Suppose that after drivers buy towing insurance, they take less care of their cars. This would be an example of

- a. monotonicity.
- b. moral hazard.
- c. substitution effects.
- d. adverse selection.

(20) People with serious health problems may be more likely to apply for long-term care insurance. This is an example of

- a. adverse selection.
- b. moral hazard.
- c. exchange efficiency.
- d. market power.

II. SHORT ANSWER: Please write your answers in the boxes on this question sheet. Use margins for scratch work.

(1) [Income elasticity of demand: 10 pts] Suppose that a consumer's income rises by 5%, and the income elasticity of demand for gasoline is 0.4 .

a. Does the income elasticity indicate that gasoline is an *inferior* good, a *necessary* good, or a *luxury or superior* good?

b. Will the quantity demanded of gasoline *increase* or *decrease*?

c. By about how much?

d. Will the share of the consumer's budget devoted to water *increase* or *decrease*?

e. By about how much?

	%
	%

(2) [Slutsky equation: 10 pts] The Slutsky equation in elasticity form is given by

$$\epsilon = -S \eta + \epsilon^{\text{comp}}$$

where, as usual, ϵ denotes the own-price elasticity of demand, S denotes the share of total consumer spending devoted to the good (a fraction), η denotes the income elasticity of demand, and ϵ^{comp} denotes the compensated demand elasticity. Suppose that for housing, $\epsilon = -0.9$, $S = 0.1$, and $\eta = 1.0$.

a. Compute the compensated elasticity of demand for housing (ϵ^{comp}).

--

First, suppose the price of housing rises by 10%, but the consumer's income does *not* change.

b. Does the quantity demanded of housing *increase* or *decrease*?

c. By about how much?

%

Alternatively, assume that the price of housing rises by 10%, but now suppose the government helps the consumer by giving them a cash transfer equal to 10% of last year's spending on housing.

d. Does the quantity demanded of housing *increase* or *decrease*?

e. By about how much?

%

(3) [Cost minimization; Cost in the short run: 10 pts] A firm wants to produce 100 units of output at lowest cost. This firm must pay \$10 per hour for labor and \$20 per hour for capital. The graph below shows the firm's isoquant for 100 units of output per hour as a dashed curve and several isocost lines as solid lines. The small circle marks a tangency.

First, suppose the firm can hire whatever amounts of labor and capital it wants.

- a. How many units of capital will it hire?
- b. How many units of labor will it hire?
- c. Compute the firm's total cost.

	units
	units
	\$

Alternatively, suppose the firm's capital input is fixed in the short run at 6 units, but the firm's labor input is variable. The firm still wants to produce 100 units of output.

- d. How many units of labor will it hire?
- e. Compute the firm's total cost in the short run.

	units
	\$

(4) [Welfare analysis of taxes and subsidies: 20 pts] The following graph shows the market for pumpkins.

a. Find the equilibrium price without government intervention.

\$

Suppose the government imposes a **tax of \$ 3** per pumpkin.

b. Compute the equilibrium quantity sold.

thousand

c. Compute the equilibrium total price paid by buyers (including the tax).

\$	per pumpkin
----	-------------

d. Compute the equilibrium net price received by sellers (excluding the tax).

\$	per pumpkin
----	-------------

e. Does producer surplus *increase, decrease, or remain constant* because of the tax?

f. By how much?

\$	thousand
----	----------

g. Does consumer surplus *increase, decrease, or remain constant* because of the tax?

h. By how much?

\$	thousand
----	----------

i. Compute the total tax revenue collected by the government.

\$	thousand
----	----------

j. Compute the deadweight social loss caused by the tax.

\$	thousand
----	----------

(5) [General equilibrium: 8 pts] Consider the graph at right of an economy's production-possibility curve. Assume this economy is in general competitive equilibrium at point A, where the slope of the production-possibility curve is $-1/2$.

- What is the opportunity cost of a unit of clothing? In other words, how many units of food must be given up in order to produce one more unit of clothing?
- What is the opportunity cost of a unit of food? In other words, how many units of clothing must be given up in order to produce one more unit of food?
- Consider the typical consumer's budget line with food on the vertical axis and clothing on the horizontal axis. What must be the slope of every consumer's budget line in this economy?
- If the price of a unit of food is \$ 4, then what must be the price of a unit of clothing?

	units of food
	units of clothing
	\$

(6) [Lerner index of market power: 4 pts] The Lerner index of market power is defined as the fraction of price that represents a markup over marginal cost: $L = (P-MC)/P$. Suppose a particular airline route has a price elasticity of demand of -4 .

- Compute the Lerner index if this market is a monopoly.
- Compute the Lerner index if this market is a symmetric Cournot oligopoly of five airlines.

(7) [Nonrival goods: 6 pts] A city government will offer a free outdoor concert series during the summer in a neighborhood park. About **1000** people are likely to enjoy the concerts. Each concert costs \$**4000** to produce. Let Q denote the number of concerts. A typical individual person's marginal benefit from the concert series is given by the following expression: $MB = 20 - 2Q$.

- How many concerts would a typical *individual* pay for, for their private enjoyment?
- Give an expression for the marginal social benefit from the concert series.
- Compute Q^* the socially-optimal number of concerts.

	concerts
MSB =	
	concerts

(8) [Game theory: 12 pts] An industry consists of two firms, A and B. Each firm chooses a low price or a high price. Payoffs are shown in the following game in normal (or strategic) form.

		Firm B	
		High price	Low price
Firm A	High price	Firm A's profit = \$10 million Firm B's profit = \$10 million	Firm A's profit = \$1 million. Firm B's profit = \$15 million.
	Low price	Firm A's profit = \$15 million. Firm B's profit = \$1 million.	Firm A's profit = \$2 million. Firm B's profit = \$2 million.

a. Which outcomes of this game (if any) are Pareto-efficient¹? Answer "YES" or "NO."

Firm A plays "High price" and Firm B plays "High price"	
Firm A plays "Low price" and Firm B plays "Low price"	
Firm A plays "High price" and Firm B plays "Low price"	
Firm A plays "Low price" and Firm B plays "High price"	

b. Which outcomes of this game (if any) are dominant-strategy equilibria²? Answer "YES" or "NO."

Firm A plays "High price" and Firm B plays "High price"	
Firm A plays "Low price" and Firm B plays "Low price"	
Firm A plays "High price" and Firm B plays "Low price"	
Firm A plays "Low price" and Firm B plays "High price"	

c. Which outcomes of this game (if any) are Nash equilibria in pure strategies? Answer "YES" or "NO."

Firm A plays "High price" and Firm B plays "High price"	
Firm A plays "Low price" and Firm B plays "Low price"	
Firm A plays "High price" and Firm B plays "Low price"	
Firm A plays "Low price" and Firm B plays "High price"	

¹ Ignore the welfare of consumers.

² "Equilibria" is the plural form of "equilibrium."

III. PROBLEMS: Please write your answers in the boxes on this question sheet. Show your work and circle your final answers.

(1) [Finding individual demand functions: 12 pts] A consumer has the following utility function: $U(q_1, q_2) = q_1^3 q_2^5$, where q_1 denotes the quantity of entertainment and q_2 denotes the quantity of other goods.

- a. Find a formula for the consumer's marginal rate of substitution in consumption of other goods for entertainment—that is, the |slope| of the consumer's indifference curve with entertainment on the vertical axis and other goods on the horizontal axis. The variables q_1 and q_2 should be the only unknowns. Circle your final answer.

Let p_1 denote the price of entertainment and let p_2 denote the price of other goods. Let I denote the consumer's income.

- b. Solve for the consumer's demand function for entertainment—that is, the formula showing q_1^* as a function of p_1 , p_2 , and I (but not q_2). Show your work and circle your final answer. [Hint: check that your answer is homogeneous of degree zero.]

- c. Solve for the consumer's demand function for other goods—that is, the formula showing q_2^* as a function of p_1 , p_2 , and I (but not q_1). Show your work and circle your final answer. [Hint: check that your answer is homogeneous of degree zero.]

(2) [Input substitution; Returns to scale: 9 pts] Suppose a production function is given by

$$q = 6x_1^{1/2} + 4x_2^{1/2}.$$

- a. Find an expression for the marginal product of input 1. Are there diminishing returns to input 1? Justify your answer.

- b. Find an expression in terms of x_1 and x_2 for the marginal rate of substitution in production of input 2 for input 1—that is, the absolute value of the slope of an isoquant, with x_1 on the vertical axis and x_2 on the horizontal axis. Does production show a diminishing marginal rate of substitution? Justify your answer.

- c. Does this production function have *constant* returns to scale, *increasing* returns to scale, or *decreasing* returns to scale? Justify your answer.

(3) [Welfare analysis of international trade: 10 pts] Suppose domestic demand and supply for a good are given by the following equations. (Use the graph at right for scratch work.)

Demand: $Q_D = 50 - 5 P$

Supply: $Q_S = 10 P - 10$

First consider the domestic market without international trade.

- a. Compute the equilibrium price and quantity without international trade.

Now suppose the market is opened to international trade, and the world price turns out to be **\$8**.

- b. Does the country *import* or *export* this good? How much?

c. Does consumer surplus *increase* or *decrease* as a result of international trade? By how much?

d. Does producer surplus *increase* or *decrease* as a result of international trade? By how much?

e. Does the country as a whole (consumers plus producers) experience an *increase* or *decrease* in economic efficiency as a result of international trade? How much?

(4) [Monopoly, profit maximization: 14 pts] Suppose a monopolist has total cost function given by $TC(Q) = 4Q + (Q^2/20)$. This monopolist faces a demand curve given by $P = 10 - (Q/10)$. Show your work and circle your final answers. Note: question continues on next page. Use graph at bottom of next page for scratch work.

- a. Find the monopolist's marginal cost function.

- b. Find the monopolist's average cost function.

- c. Find the monopolist's marginal revenue function.

- d. Compute the monopolist's profit-maximizing level of output Q_M .

- e. Compute the monopolist's profit-maximizing price P_M .

f. Compute the monopolist's profit.

g. Compute the social deadweight loss caused by the monopolist. (You may use the graph for scratch work.)

(5) [External cost and Pigou tax: 10 pts] Suppose supply and demand for a particular pesticide are given by the following equations. Use the graph at right for scratch work.

Demand: $P_D = 20 - (Q/10)$.

Supply: $P_S = 4 + (Q/10)$.

- a. Compute the unregulated equilibrium price and quantity.

Unfortunately, the use of this pesticide pollutes sources of drinking water, creating an external cost. Marginal external cost per unit is estimated to be $MEC = 1 + (Q/10)$.

- b. Find a formula for the marginal social cost of the pesticide.

- c. Compute the socially optimal quantity of output of the pesticide.

- d. Compute the deadweight loss from unregulated competition.

- e. Compute the Pigou tax rate on this pesticide, in dollars per unit, that would result in the socially optimal quantity of the chemical.

(6) [Uncertainty, risk aversion, demand for insurance: 10 pts] Aaron has \$200 in income but faces a 25% chance of losing \$160 and thus being reduced to only \$40 in income. Aaron's utility function is given by $U(I) = 20 - (400/I)$, where I denotes income.

- a. Compute Aaron's expected income (in dollars).

- b. Compute Aaron's expected utility (in utils).

- c. Compute the level of risk-free income that would be just as desirable as Aaron's current risky situation (in dollars).

- d. Compute the maximum insurance premium Aaron would be willing to pay for full insurance against potential loss.

- e. Compute the so-called "fair insurance" premium for full insurance against Aaron's potential loss.

(7) [Hidden characteristics and adverse selection: 10 pts] Suppose the market for homeowners insurance consists of 1000 people. Order these people from high-risk to low-risk, and index them by $Q = 0$ to 1000. The expected loss of the Q th person is given by $EL = 120 - 0.1 Q$. (Thus the last person's expected loss is about \$20.) Everyone is risk-averse, and willing to pay \$30 more than their expected loss (EL) for insurance.

- a. Give an equation for the demand for insurance P_D or willingness-to-pay, as a function of Q .

- b. Give an equation for the marginal cost of insurance MC as a function of Q . (Assume there are no administrative costs.)

- c. If the market were efficient, how many people would get insurance? Why?

- d. Give an equation for the average cost of insurance AC as a function of Q . [Hint: AC has the same intercept but half the slope of MC .]

- e. Assume the market is competitive, but that insurance companies cannot observe individual persons' expected loss. Find the equilibrium price P and quantity Q of insurance.

IV. CRITICAL THINKING: Answer just *one* question below (your choice). [5 pts]

(1) Suppose a consumer normally buys 20 gallons of gasoline per month at a price of \$3. Which would this consumer prefer: a reduction in price from \$3 to \$1, or an increase in income of \$40? Justify your answer with a graph of a demand curve. Use the concept of consumer surplus.

(2) Exchange efficiency (also called "efficiency in distribution") requires that each consumer's marginal rate of substitution in consumption (MRSC) of food for clothing be equal to every other consumer's MRSC of food for clothing. Is this condition satisfied in an unregulated economy with competitive markets? Why or why not? (Ignore the graph.)

Circle the question you are answering and write your answer below. Full credit requires good grammar, legible writing, accurate spelling, and correct reasoning.

[end of exam]
