

**Problem Set 5**  
**“Probability: Important Distributions”**

(5.1) [Bernoulli random variable] Suppose the variable  $X$  is a Bernoulli random variable, equal to 1 with probability  $P$ , and equal to 0 with probability  $(1-P)$ . Here,  $P$  is a number between zero and one.

- a. Prove that  $E(X) = P$ . Justify each step of your proof.
- b. Prove that  $\text{Var}(X) = P(1-P)$ . Justify each step of your proof.
- c. Use calculus to find the value of  $P$  that maximizes the  $\text{Var}(X)$ .
- d. Compute the maximum value of  $\text{Var}(X)$ .

(5.2) [Distributions related to the normal] Which of the following distributions have *symmetric* distributions covering the entire real line? Which of the following distributions have *asymmetric* density functions covering only the positive half of the real line?

- a. Normal distribution.
- b. Chi-square distribution.
- c. “t” distribution.
- d. “F” distribution.

(5.3) [Standard normal statistical table] Use the tables of critical values in the back of your textbook to answer the following questions. Suppose  $Z$  is a standard normal random variable. [Hint: The last row of the table of the t-distribution, with degrees of freedom =  $\infty$ , shows the standard normal distribution.]

- a. If  $\text{Prob}\{Z > z\} = 0.05$ , then what number is  $z$ ?
- b. If  $\text{Prob}\{|Z| > z\} = 0.05$ , then what number is  $z$ ? [Hint: Remember that the distribution is symmetric around zero.]
- c. Why is your answer to (b) greater than your answer to (a)?
- d. If  $\text{Prob}\{|Z| > z\} = 0.01$ , then what number is  $z$ ?

(5.4) [Chi-square statistical table] Use the tables of critical values in the back of your textbook to answer the following questions. Suppose  $Y$  is a random variable with an “chi-square” distribution with 12 degrees of freedom.

- a. If  $\text{Prob}\{Y > y\} = 0.05$ , then what number is  $y$ ?
- b. If  $\text{Prob}\{Y > y\} = 0.01$ , then what number is  $y$ ?
- c. Why is your answer to (b) greater than your answer to (a)?

(5.5) [“t” distribution statistical table] Use the tables of critical values in the back of your textbook to answer the following questions. Suppose  $W$  is a random variable with a “t” distribution with 15 degrees of freedom.

- a. If  $\text{Prob}\{W > w\} = 0.05$ , then what number is  $w$ ?
- b. If  $\text{Prob}\{|W| > w\} = 0.01$ , then what number is  $w$ ? [Hint: Remember that this distribution is symmetric around zero.]

(5.6) [“F” distribution statistical table] Use the tables of critical values in the back of your textbook to answer the following questions. Suppose  $V$  is a random variable with an “F” distribution with 5 degrees of freedom in the numerator and 25 degrees of freedom in the denominator.

- a. If  $\text{Prob}\{V > v\} = 0.05$ , then what number is  $v$ ?
- b. If  $\text{Prob}\{V > v\} = 0.01$ , then what number is  $v$ ?

(5.7) [Functions of normal random variables] Fill in the blanks below.

- a. If  $X_1 \sim N(2,3)$  then  $X_2 = (3X_1 + 5)$  has a \_\_\_\_\_ distribution with mean  $E(X_2) = \underline{\hspace{2cm}}$  and variance  $\text{Var}(X_2) = \underline{\hspace{2cm}}$ .
- b. If  $X_1 \sim N(2,3)$  and  $X_2 \sim N(6,4)$ , and  $X_1$  and  $X_2$  are independent, then  $X_3 = (X_1 + X_2)$  has a \_\_\_\_\_ distribution with mean  $E(X_3) = \underline{\hspace{2cm}}$  and variance  $\text{Var}(X_3) = \underline{\hspace{2cm}}$ .
- c. If  $X_1, X_2,$  and  $X_3$  are independent normal random variables, each with mean equal to zero and variance equal to one, then  $X_4 = (X_1^2 + X_2^2 + X_3^2)$  has a \_\_\_\_\_ distribution with \_\_\_\_\_ degrees of freedom.

(5.8) [Functions of chi-square random variables] Fill in the blanks below.

- a. If  $X_1$  has a chi-square distribution with 2 degrees of freedom, and  $X_2$  has a chi-square distribution with 4 degrees of freedom, and  $X_1$  and  $X_2$  are independent, then  $X_3 = (X_1 + X_2)$  has a \_\_\_\_\_ distribution with \_\_\_\_\_ degrees of freedom.
- b. If  $X_1$  has a chi-square distribution with 3 degrees of freedom, and  $X_2$  has a chi-square distribution with 12 degrees of freedom, and  $X_1$  and  $X_2$  are independent, then  $X_3 = (4X_1/X_2)$  has a \_\_\_\_\_ distribution with \_\_\_\_\_ and \_\_\_\_\_ degrees of freedom.
